## Introduction to Machine Learning

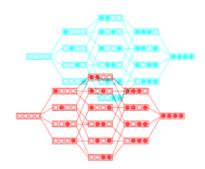

Feature Selection: Wrapper methods

Feature Selection: Wrapper methods

Learning goals

- Understand how wrapper methods work
- Understand how they can help in Learning goals
  - Understand how wrapper methods owork antages
  - Forward + backward search, EAs
  - Advantages and disadvantages

## OBJECTIVE FUNCTION

Given p features, **best-subset selection problem** is to find subset  $S \subseteq \{1, \dots p\}$  optimizing objective  $\Psi : \Omega \to \mathbb{R}$ :

```
SS = \arg \min_{S \in \Omega} \{ \Psi(S) \}
```

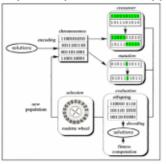

- $\Omega$  = search space of all feature subsets  $S \subseteq \{1, ..., p\}$ . Usually we encode this by bit vectors, i.e.,  $\Omega = \{0, 1\}^p$  (1 = feat. selected)
- Objective Ψ can be different functions, e.g., AIC/BIC for LM or cross-validated performance of a learner
- Poses a discrete combinatorial optimization problem over search space of size = 2<sup>p</sup>, i.e., grows exponentially in p (power set)
- Unfortunately can not be solved efficiently in general (NP hard; see, e.g., Natarajan 1995)
- Can avoid searching entire space by employing efficient search strategies, traversing search space in a "smart" way

## **EXTENSIONS: GENETIC ALGORITHMS FOR FS**

**Example** Template for  $(\mu + \lambda)$ -Evolutionary Strategy applied to FS

- lacktriangled Initialization:  $\mu$  random bit vectors (feature inclusion/exclusion)
- Evaluate model performance for bit vectors
- Select μ fittest bit vectors (parents)
- lacktriangle Generate  $\lambda$  offspring applying crossover and mutation
- Select  $\mu$  fittest bit vectors from  $(\mu + \lambda)$  options for next generation
- Repeat steps 2-5 until stopping criterion is met

- Use CV/validation set for evaluation to avoid overfitting
- Choice of μ and λ allows some control over exploration vs. exploitation trade-off
- See our further information mation
