Introduction to Machine Learning

Nonlinear Support Vector Machines **Feature Generation for Nonlinear** Separation

Learning goals

Learning goalsw nonlinearity can

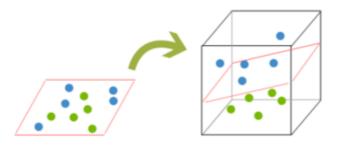

- introduced via feature maps in SVMs
- Know the limitation of feature maps

NONLINEARITY VIA FEATURE MAPS

- How to extend a linear classifier, e.g. the SVM, to nonlinear separation between classes?
- We could project the data from 2D into a richer 3D feature space!

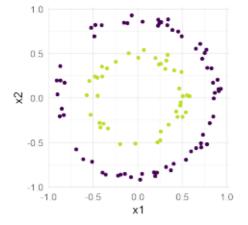

NONLINEARITY VIA FEATURE MAPS /2

In order to "lift" the data points into a higher dimension, we have to find a suitable **feature map** $\phi: \mathcal{X} \to \Phi$. Let us consider another example where the classes lie on two concentric circles:

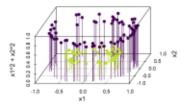

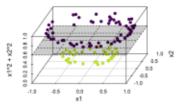

NONLINEARITY VIA FEATURE MAPS /3

We apply the feature map $\phi(x_1,x_2)=(x_1,x_2,x_1^2+x_2^2)$ to map our points into a 3D space. Now our data can be separated by a hyperplane.

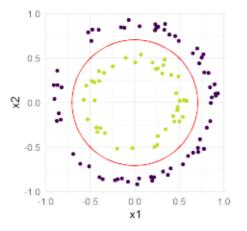

NONLINEARITY VIA FEATURE MAPS /4

The hyperplane learned in $\Phi\subset\mathbb{R}^3$ yields a nonlinear decision boundary when projected back to $\mathcal{X}=\mathbb{R}^2.$

FEATURE MAPS: COMPUTATIONAL LIMITATIONS

Let us have a look at a similar nonlinear feature map $\phi:\mathbb{R}^2\to\mathbb{R}^5$, where we collect all monomial feature extractors up to degree 2 (pairwise interactions and quadratic effects):

$$\phi(x_1,x_2)=(x_1^2,x_2^2,x_1x_2,x_1,x_2).$$

For p features vectors, there are k_1 different monomials where the degree is exactly d, and k_2 different monomials up to degree d.

$$k_1 = \begin{pmatrix} d+p-1 \\ d \end{pmatrix}$$
 $k_2 = \begin{pmatrix} d+p \\ d \end{pmatrix} - 1$

Which is quite a lot, if p is large.

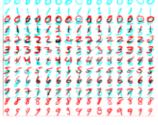

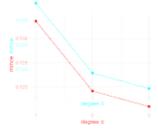

FEATURE MAPS: COMPUTATIONAL LIMITATIONS

/ 2

Let us see how well we can classify the 28 × 28-pixel images of the handwritten digits

Let us see how welf we can classify the 28×28 pixel images of the handwritten digits of the MNIST dataset (70K observations across 10 classes). We use SVM with a the nonlinear feature map which projects the images to a space of all monomials up to the degree d and C=1:

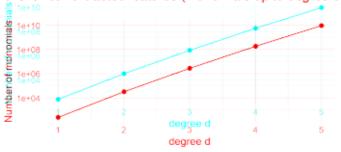

For this scenario, with increasing degree d the test mmce decreases.

NB: We handle the multiclass task with the "one-against-one" approach. We are NB: We handle the multiclass task with the "one-against-one" approach. We are somewhat lazy and only use 700 observations to train (rest for testing). We do not do any tuning - as we always should for the SVM!

FEATURE MAPS: COMPUTATIONAL LIMITATIONS

However, even a 16×16 -pixel input image results in infeasible However, even a 16×16 -pixel input image results in infeasible d). dimensions for our extracted features (monomials up to degree d).

Are we at a "dead end"?

Answer: No, this is why kernels exist!
