# **Introduction to Machine Learning**

# **Evaluation Measures for Regression**

#### **Learning goals**

- Know the definitions of mean squared error (MSE) and mean absolute error (MAE)
- $\bullet$  Understand the connections of MSF and MAE to L2 and L1 loss
- Know the definition of Spearman's  $\rho$ ۰
- Know the definitions of *R* <sup>2</sup> and  $\bullet$ generalized *R* 2

#### **MEAN SQUARED ERROR (MSE)**

$$
\rho_{MSE}(\mathbf{y}, \mathbf{F}) = \frac{1}{m} \sum_{i=1}^{m} (y^{(i)} - \hat{y}^{(i)})^2 \in [0; \infty) \qquad \rightarrow \text{L2 loss}.
$$

 $6.65$  1.15

0 2 4 x

Outliers with large prediction error heavily influence the MSE, as they enter quadratically.

Similar measures:

• Sum of squared errors: 
$$
\rho_{SSE}(\mathbf{y}, \mathbf{F}) = \sum_{i=1}^{m} (\mathbf{y}^{(i)} - \hat{\mathbf{y}}^{(i)})^2
$$

1  $2 3 \geq 4$ 5- .............. 6 7

. . . . . . . . . .

• Root MSE (orig. scale): 
$$
\rho_{RMSE}(\mathbf{y}, \mathbf{F}) = \sqrt{\frac{1}{m} \sum_{i=1}^{m} (y^{(i)} - \hat{y}^{(i)})^2}
$$

#### **MEAN ABSOLUTE ERROR**

$$
\rho_{\text{MAE}}(\mathbf{y}, \mathbf{F}) = \frac{1}{m} \sum_{i=1}^{m} |y^{(i)} - \hat{y}^{(i)}| \in [0; \infty) \qquad \rightarrow \text{L1 loss}.
$$

More robust, less influenced by large residuals, more intuitive than MSE.

Similar measures:

 $\bullet$  Median absolute error (for even more robustness)

### **MEAN ABSOLUTE PERCENTAGE ERROR**

$$
\rho_{\text{MAPE}}(\mathbf{y}, \mathbf{F}) = \frac{1}{m} \sum_{i=1}^{m} \left| \frac{y^{(i)} - \hat{y}^{(i)}}{y^{(i)}} \right| \in [0; \infty)
$$

X  $\times$   $\times$ 

Similar measures:

- Mean Absolute Scaled Error (MASE)
- Symmetric Mean Absolute Percentage Error (sMAPE)

$$
\rho_{R^2}(\mathbf{y}, \mathbf{F}) = 1 - \frac{\sum_{i=1}^{m} (y^{(i)} - \hat{y}^{(i)})^2}{\sum_{i=1}^{m} (y^{(i)} - \bar{y})^2} = 1 - \frac{SSE_{LinMod}}{SSE_{Intercept}}.
$$

 $\overline{\mathbf{X}}$ 

- Well-known classical measure for LMs on train data.
- "Fraction of variance explained" by the model.
- How much SSE of constant baseline is reduced when we use more complex model?
- $\rho_{R^2} = 1$ : all residuals are 0, we predict perfectly,
- $\rho_{R^2} = 0.9$ : LM reduces SSE by factor of 10.  $\rho_{B2} = 0$ : we predict as badly as the constant model.
- Is  $\in$  [0, 1] on train data; as LM is always better than intercept.

# *R* <sup>2</sup> **VS MSE**

- Better *R* <sup>2</sup> does not necessarily imply better fit.
- $\bullet$  Data:  $y = 1.1x + \epsilon$ , where  $\epsilon \sim \mathcal{N}(0, 0.15)$ .
- Fit half (black) and full data (black and red) with LM.

- Fit does not improve, but *R* <sup>2</sup> goes up.
- But: Invariant w.r.t. to linear scaling of *y*, MSE is not.

**XX** 

## **GENERALIZED** *R* <sup>2</sup> **FOR ML**

1 − *LossComplexModel LossSimplerModel* .

- E.g., model vs constant, LM vs non-linear model, tree vs forest, model with fewer features vs model with more, ...
- We could use arbitrary measures.
- **.** In ML we would rather evaluate on test set.
- Can then become negative, e.g., for SSE and constant baseline, if our model fairs worse on the test set than a simple constant.

#### **SPEARMAN'S** ρ

Can be used if we care about the relative ranks of predictions:

$$
\rho_{\text{Spearman}}(\bm{y}, \bm{F}) = \frac{\text{Cov}(\text{rg}(\bm{y}), \text{rg}(\hat{\bm{y}}))}{\sqrt{\text{Var}(\text{rg}(\bm{y}))} \cdot \sqrt{\text{Var}(\text{rg}(\hat{\bm{y}}))}} \in [-1, 1],
$$

- Very robust against outliers
- A value of 1 or -1 means that  $\hat{y}$  and  $y$  have a perfect monotonic relationship.
- **■** Invariant under monotone transformations of  $\hat{y}$
