## **Optimization in Machine Learning**

# Evolutionary Algorithms GA / Bit Strings

× 0 0 × × ×

#### Learning goals

- Recombination
- Mutation
- Simple examples

#### **BINARY ENCODING**

- In theory: Each problem can be encoded binary
- In practice: Binary not always best representation (e.g., if values are numeric, trees or programs)

We typically encode problems with **binary decision variables** in binary representation.

#### Examples:

- Scheduling problems
- Integer / binary linear programming
- Feature selection

## **RECOMBINATION FOR BIT STRINGS**

Two individuals  $\mathbf{x}, \tilde{\mathbf{x}} \in \{0, 1\}^d$  encoded as bit strings can be recombined as follows:

• **1-point crossover:** Select crossover  $k \in \{1, ..., d - 1\}$  randomly. Take first *k* bits from parent 1 and last d - k bits from parent 2.

× × 0 × × ×

 Uniform crossover: Select bit *j* with probability *p* from parent 1 and 1 - *p* from parent 2.

$$\begin{array}{cccccc} 1 & 0 & & 1 \\ 0 & 0 & & 0 \\ 0 & 1 & \Rightarrow & 1 \\ 0 & 1 & & 1 \\ 1 & 0 & & 1 \end{array}$$

## **MUTATION FOR BIT STRINGS**

Offspring  $\boldsymbol{x} \in \{0,1\}^d$  encoded as a bit string can be mutated as follows:

• **Bitflip:** Each bit *j* is flipped with probability  $p \in (0, 1)$ .

$$\begin{array}{cccc} 1 & & 0 \\ 0 & & 0 \\ 0 & \Rightarrow & 0 \\ 0 & & 1 \\ 1 & & 1 \end{array}$$

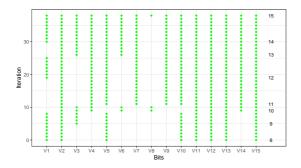

#### **EXAMPLE 1: ONE-MAX EXAMPLE**

 $\mathbf{x} \in \{0, 1\}^d, d = 15$  bit vector representation.

Goal: Find the vector with the maximum number of 1's.

- Fitness:  $f(\mathbf{x}) = \sum_{i=1}^{d} x_i$
- $\mu = 15, \lambda = 5, (\mu + \lambda)$ -strategy, bitflip mutation, no recombination

Green: Representation of best individual per iteration. Right scale shows fitness.

#### **EXAMPLE 2: FEATURE SELECTION**

We consider the following toy setting:

- Generate design matrix X ∈ ℝ<sup>n×p</sup> by drawing n = 1000 samples of p = 50 independent normally distributed features with μ<sub>j</sub> = 0 and σ<sub>i</sub><sup>2</sup> > 0 varying between 1 and 5 for j = 1,..., p.
- Linear regression problem with dependent variable y:

 $\mathbf{y} = \mathbf{X}\boldsymbol{\theta} + \boldsymbol{\epsilon}$ 

with  $\epsilon \sim \mathcal{N}(0, 1)$ .

Parameter  $\theta$ :

 $\Rightarrow$  Only 8 out of 50 equally influential features

× 0 0 × × ×

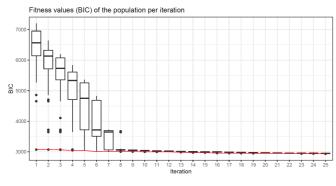

#### EXAMPLE 2: FEATURE SELECTION / 2

- Aim: Find influential features
- Encoding:  $z \in \{0, 1\}^p$ ,  $z_j = 1$  means  $\theta_j$  included in model
- Fitness function f(z): BIC of the model belonging to z
- Mutation: Bit flip with p = 0.3
- **Recombination:** Uniform crossover with p = 0.5
- Survival selection:  $(\mu + \lambda)$  strategy with  $\mu = 100$  and  $\lambda = 50$
