

Introduction to Machine Learning

Nonlinear Support Vector Machines The Polynomial Kernel

svm: kernel polynomial, degree=2, coef0=1
Train: mince=0.1700002, CV: mince/test:mean=0.2500000

svm: kernel polynomial, degree=9, coef0=1
Train: mince=0.0599997, CV: mince/test:mean=0.1200000

Learning goals

- Know the homogeneous and non-homogeneous polynomial kernel
- Understand the influence of the choice of the degree on the decision boundary

HOMOGENEOUS POLYNOMIAL KERNEL

$$k(\mathbf{x}, \tilde{\mathbf{x}}) = (\mathbf{x}^T \tilde{\mathbf{x}})^d, \text{ for } d \in \mathbb{N}$$

The feature map contains all monomials of exactly order d .

$$\phi(\mathbf{x}) = \left(\sqrt{\binom{d}{k_1, \dots, k_p}} x_1^{k_1} \dots x_p^{k_p} \right)_{k_i \geq 0, \sum_i k_i = d}$$

That $\langle \phi(\mathbf{x}), \phi(\tilde{\mathbf{x}}) \rangle = k(\mathbf{x}, \tilde{\mathbf{x}})$ holds can easily be checked by simple calculation and using the multinomial formula

$$(x_1 + \dots + x_p)^d = \sum_{k_i \geq 0, \sum_i k_i = d} \binom{d}{k_1, \dots, k_p} x_1^{k_1} \dots x_p^{k_p}$$

The map $\phi(\mathbf{x})$ has $\binom{p+d-1}{d}$ dimensions. We see that $\phi(\mathbf{x})$ contains no terms of "lesser" order, so, e.g., linear effects. As an example for $p = d = 2$: $\phi(\mathbf{x}) = (x_1^2, x_2^2, \sqrt{2}x_1x_2)$.

NONHOMOGENEOUS POLYNOMIAL KERNEL

$$k(\mathbf{x}, \tilde{\mathbf{x}}) = (\mathbf{x}^T \tilde{\mathbf{x}} + b)^d, \text{ for } b \geq 0, d \in \mathbb{N}$$

The maths is very similar as before, we kind of add a further constant term in the original space, with

$$(\mathbf{x}^T \tilde{\mathbf{x}} + b)^d = (x_1 \tilde{x}_1 + \dots + x_p \tilde{x}_p + b)^d$$

The feature map contains all monomials up to order d .

$$\phi(\mathbf{x}) = \left(\sqrt{\binom{d}{k_1, \dots, k_{p+1}}} x_1^{k_1} \dots x_p^{k_p} b^{k_{p+1}/2} \right)_{k_i \geq 0, \sum_i k_i = d}$$

The map $\phi(\mathbf{x})$ has $\binom{p+d}{d}$ dimensions. For $p = d = 2$:

$$(x_1 \tilde{x}_1 + x_2 \tilde{x}_2 + b)^2 = x_1^2 \tilde{x}_1^2 + x_2^2 \tilde{x}_2^2 + 2x_1 x_2 \tilde{x}_1 \tilde{x}_2 + 2bx_1 \tilde{x}_1 + 2bx_2 \tilde{x}_2 + b^2$$

Therefore,

$$\phi(\mathbf{x}) = (x_1^2, x_2^2, \sqrt{2}x_1 x_2, \sqrt{2b}x_1, \sqrt{2b}x_2, b)$$

POLYNOMIAL KERNEL

Degree $d = 1$ yields a linear decision boundary.

svm: kernel=polynomial; degree=1; coef0=1
Train: mmce=0.0700000; CV: mmce.test.mean=0.1100000

svm: kernel=polynomial; degree=1; coef0=1
Train: mmce=0.5000000; CV: mmce.test.mean=0.5066667

POLYNOMIAL KERNEL / 2

The higher the degree, the more nonlinearity in the decision boundary.

svm: kernel=polynomial; degree=3; coef0=1
Train: mmce=0.0900000; CV: mmce.test.mean=0.1200000

svm: kernel=polynomial; degree=3; coef0=1
Train: mmce=0.1033333; CV: mmce.test.mean=0.1233333

POLYNOMIAL KERNEL / 3

The higher the degree, the more nonlinearity in the decision boundary.

svm: kernel=polynomial; degree=9; coef0=1
Train: mmce=0.1700000; CV: mmce.test.mean=0.2500000

svm: kernel=polynomial; degree=9; coef0=1
Train: mmce=0.0566667; CV: mmce.test.mean=0.1200000

POLYNOMIAL KERNEL / 4

For $k(\mathbf{x}, \tilde{\mathbf{x}}) = (\mathbf{x}^\top \tilde{\mathbf{x}} + 0)^d$ we get no lower order effects.
